

RESEARCH TOPIC FOR THE PARISTECH/CSC PHD PROGRAM

Field: *Materials Science, Mechanics, Fluids*

Subfield: Materials science and mechanics

Title: Experimental and numerical development of a High-Entropy High-Temperature Shape Memory Alloy (HE-HTSMA)

ParisTech School: Arts et Métiers Sciences et Technologies

Advisor(s) Name: Fodil MERAGHNI and Sophie BERVEILLER

Advisor(s) Email: fodil.meraghni@ensam.eu ;

sophie.berveiller@ensam.eu

Research group/Lab: SMART/LEM3

Lab location: Metz (France). www.Lem3.univ-metz.fr

(Lab/Advisor website):

Short description of possible research topics for a PhD:

One on hand, High Entropy alloys are under development: these single-phased materials contain at least 5 chemical elements which is responsible for high mechanical properties. On the other hand, SMAs exhibit superelastic and/or shape memory effect, induced by a reversible martensitic transformation that can occur at high temperatures (leading to the so-called HTSMA). The aim of this study is to combine both behavior, HE and HTSMA, to develop a HE-HTSMA in order to improve the mechanical properties of a Ti-Nb SMA over a large range of temperature. For that purpose, two main objectives will be achieved:

- Experimental part: first, the specific composition will be chosen based on HE criteria. After elaboration, the microstructure and mechanical behavior will be characterized and optimized by thermal treatments.

- Numerical part: based on these experimental data, a micromechanical model will be developed taking into account the martensitic transformation in the behavior law.

Required background of the student: materials science, diffraction
